CEBRA Annual Conference

The Role of International Trade in the Transmission of Inflationary Pressures during the Recent High Inflation Episode

This paper

► What?

- * Quantify inflation drivers when economy is hit by different set of shocks
- * Key: open economy → allow to study spillovers across countries-sectors

This paper

► What?

- * Quantify inflation drivers when economy is hit by different set of shocks
- * Key: open economy → allow to study spillovers across countries-sectors

► Why?

- * Highest inflation of last four decades
- * Characterized by:
 - + Collapse and rebound in domestic demand, GDP and international trade
 - + Consumption substitution across sectors
 - + Labor shortages
- * Requires a model

This paper

► **How?** → Multi-country multi-sector model

- * Theory: extends Baqaee and Farhi (2022, AER) to an open economy
- * Segmented factor markets + downward nominal wage rigidity
- * Allow for a nominal block to tie real shocks to nominal variables
 - + countries conduct independent monetary policy → flexible exchange rates
- * Takes model to the data
 - + 4 Countries: United States, Euro Area, Russia, and China+RoW
 - + 4 Sectors: durables, non-durables, services, and energy (extension to 44 in the paper)
 - + Rich set of shocks: sectoral supply, sectoral demand, aggregate demand and energy shocks
 - + Conduct counterfactuals: what if only supply shocks? ... demand shocks? ... energy shocks?

What we find: the narrative

► 2020

What we find: the narrative

► 2020

- * Negative supply shocks to factors of production: ↑ inflation
- * Negative aggregate demand shocks: ↓ inflation
- * Low inflation in 2020

What we find: the narrative

► 2020

- * Negative supply shocks to factors of production: ↑ inflation
- * Negative aggregate demand shocks: ↓ inflation
- * Low inflation in 2020

► 2021

What we find: the narrative

► 2020

- * Negative supply shocks to factors of production: ↑ inflation
- * Negative aggregate demand shocks: ↓ inflation
- * Low inflation in 2020

► 2021

- * Negative supply shocks: ↑ inflation
- * Positive aggregate demand shocks e.g. fiscal stimulus: ↑ inflation
- * Lower role for sectoral demand shocks but not negligible: ↑ inflation

What we find: the narrative

► 2020

- * Negative supply shocks to factors of production: ↑ inflation
- * Negative aggregate demand shocks: ↓ inflation
- * Low inflation in 2020

► 2021

- * Negative supply shocks: ↑ inflation
- * Positive aggregate demand shocks e.g. fiscal stimulus: ↑ inflation
- * Lower role for sectoral demand shocks but not negligible: ↑ inflation

► 2022

What we find: the narrative

► 2020

- * Negative supply shocks to factors of production: ↑ inflation
- * Negative aggregate demand shocks: ↓ inflation
- * Low inflation in 2020

► 2021

- * Negative supply shocks: ↑ inflation
- * Positive aggregate demand shocks e.g. fiscal stimulus: ↑ inflation
- * Lower role for sectoral demand shocks but not negligible: ↑ inflation

► 2022

- * Still strong aggregate demand: ↑ inflation
- * Sectoral supply shocks started to recede: ↓ inflation
- * Energy price changes
 - + Higher impact on the euro area but increases inflation everywhere: ↑ inflation

What we find cted'

- ▶ International spillovers: larger in euro area than the US.
- ▶ Model matches well
 - * other aggregate moments: current account to GDP ratio, bilateral exchange rates (qual.)
 - * cross-sectional moments: sector-level prices and wages
- ▶ Role of disaggregation: model with more sectors does better

► **Our contribution:** a structural GE model to quantify inflation drivers with

- * global I-O linkages
- * downward nominal wage rigidity + segmented factor markets
- * endogenous exchange rates
- * rich set of shocks and counterfactuals

Outline

- ▶ Model
- ▶ Calibration
- ▶ Results
- ▶ Conclusion

Model

Inflation in a multi-country multi-sector model

- ▶ Open economy extension of Baqaee and Farhi (2022, AER):
 - * Two-period **multi-country** model ($n, m = 1, \dots, \mathcal{N}$)
 - * Multiple sectors ($i, j = 1, \dots, \mathcal{J}$) produce using factors and intermediate inputs
 - * Ricardian households with perfect foresight
 - * Have access to a domestic and a **world bond** denominated in US dollars
 - * Perfect competition in factors and good markets
 - * Monetary policy is conducted independently in each country
- ▶ Frictions:
 - * Downward nominal wage rigidity (**in local currency**)
 - * Segmented factor markets

Households in Country n : Inter-temporal Problem

$$\max_{\{C_{n,0}, C_{n,1}, F_{n,0}, B_{n,0}\}} (1 - \beta_{n,0}) \frac{C_{n,0}^{1-\sigma}}{1-\sigma} + \beta_{n,0} \frac{C_{n,1}^{1-\sigma}}{1-\sigma}$$

s.t.

$$P_{n,0}C_{n,0} + B_{n,0} + \mathcal{E}_{n,0}F_{n,0} \leq \sum_i (W_{ni,0}L_{ni,0} + R_{ni,0}K_{ni,0}),$$

$$P_{n,1}C_{n,1} \leq \mathcal{E}_{n,1} \sum_i (W_{ni,1}L_{ni,1} + R_{ni,1}K_{ni,1}) + (1 + i_{n,0})B_{n,0} + \mathcal{E}_{n,1}(1 + i_{US,0})F_{n,0},$$

- ▶ B_n : domestic bond denominated in local currency. Traded domestically.
- ▶ F_n : world bond denominated in US dollars. Internationally traded.
- ▶ \mathcal{E}_n : exchange rate between country n and the US (lcu per dollar)
- ▶ i_n : domestic interest rate
- ▶ i_{US} : US interest rate

Households in Country “n”: Intertemporal Optimality

- ▶ Optimality conditions

$$\phi_{n,0} \frac{C_{n,0}^{-\sigma}}{P_{n,0}} = \frac{C_{n,1}^{-\sigma} (1 + i_{n,0})}{P_{n,1}} \quad (\text{Euler Equation})$$

$$(1 + i_{n,0}) = (1 + i_{US,0}) \frac{\mathcal{E}_{n,1}}{\mathcal{E}_{n,0}} \quad (\text{Interest Parity Condition})$$

- ▶ $\phi_{n,0} = (1 - \beta_{n,0})/\beta_{n,0}$
- ▶ X : steady-state value. 0 present where shocks happen, 1 future.
- ▶ $\hat{X}_t = X_t/X$: deviation from steady-state.
- ▶ From now on, assume future variables are at steady state and $\sigma = 1$.

Monetary policy and exchange rates

- ▶ World expenditure (in US dollars) is *endogenous*

$$\hat{E}_{W,o}^{\$} = \frac{1}{(1 + i_{US,o})} \sum_n \alpha_n \hat{\phi}_{n,o}; \quad \alpha_n = (P_n C_n / \mathcal{E}_n) / \sum_m P_m C_m / \mathcal{E}_m$$

- ▶ Bilateral exchange rates depend only on stance of domestic monetary policies

$$\frac{\mathcal{E}_{n,o}}{\bar{\mathcal{E}}_n} = \frac{(1 + i_{US,o})}{(1 + i_{n,o})}$$

- ▶ We use data on E_n and $1 + i_{n,o}$ to back out discount factor changes

$$\hat{\phi}_{n,o} = \hat{E}_{n,o}(1 + i_{n,o})$$

Disaggregated Consumption

- Consumption bundle consists of country-specific sectoral consumption bundles:

$$C_n = \prod_{j=1}^{\mathcal{J}} C_{n,j}^{\Omega_{n,j}^C}, \quad \sum_{j=1}^{\mathcal{J}} \Omega_{n,j}^C = 1$$

- Country-specific sectoral consumption bundles: Armington aggregator

$$C_{n,j} = \left[\sum_{m=1}^{\mathcal{C}} (\Omega_{n,mj}^{CB})^{\frac{1}{\xi^C}} C_{n,mj}^{\frac{\xi^C-1}{\xi^C}} \right]^{\frac{\xi^C}{\xi^C-1}}, \quad \sum_{m=1}^{\mathcal{N}} \Omega_{n,mj}^{CB} = 1$$

Disaggregated Production

- Sectors produce combining factors (value-added) and intermediate bundle.

$$\min_{\{VA_{ni}, M_{ni}\}} P_{ni}^{VA} VA_{ni} + P_{ni}^M Z_{ni}$$

s.t.

$$Y_{ni} = A_{ni} \left[(\Omega_{ni,VA}^Y)^{\frac{1}{\theta}} VA_{ni}^{\frac{\theta-1}{\theta}} + (\Omega_{ni,Z}^Y)^{\frac{1}{\theta}} Z_{ni}^{\frac{\theta-1}{\theta}} \right]^{\frac{\theta}{\theta-1}} \quad \text{with} \quad \Omega_{ni,VA}^Y + \Omega_{ni,Z}^Y = 1$$

- Value-added bundle is composed of Labor and Capital:

$$VA_{ni} = \left[(\Omega_{ni,L}^{VA})^{\frac{1}{\eta}} (L_{ni})^{\frac{\eta-1}{\eta}} + (\Omega_{ni,K}^{VA})^{\frac{1}{\eta}} (\bar{K}_{ni})^{\frac{\eta-1}{\eta}} \right]^{\frac{\eta}{\eta-1}} \quad \text{with} \quad \Omega_{ni,L}^{VA} + \Omega_{ni,K}^{VA} = 1$$

Intermediate goods' aggregation

- ▶ Intermediate bundle consists of country specific sectoral bundles:

$$Z_{ni} = \left[\sum_{j=1}^{\mathcal{J}} (\Omega_{ni,j}^Z)^{\frac{1}{\varepsilon}} X_{ni,j}^{\frac{\varepsilon-1}{\varepsilon}} \right]^{\frac{\varepsilon}{\varepsilon-1}} \quad \text{with} \quad \sum_{j=1}^{\mathcal{J}} \Omega_{ni,j}^Z = 1$$

- ▶ Country-specific sectoral bundles: Armington aggregator

$$X_{n,j} = \left[\sum_{m=1}^{\mathcal{N}} (\Omega_{n,mj}^X)^{\frac{1}{\xi_j^S}} X_{n,mj}^{\frac{\xi_j^S-1}{\xi_j^S}} \right]^{\frac{\xi_j^S}{\xi_j^S-1}} \quad \text{with} \quad \sum_{m=1}^{\mathcal{N}} \Omega_{n,mj}^X = 1$$

Market clearing

- Goods market clearing (as consumption or intermediate goods)

$$Y_{ni} = \sum_{m=1}^{\mathcal{N}} (X_{m,ni} + C_{m,ni}) \quad \text{for each country-sector } n, i$$

Market clearing

- Goods market clearing (as consumption or intermediate goods)

$$Y_{ni} = \sum_{m=1}^{\mathcal{N}} (X_{m,ni} + C_{m,ni}) \quad \text{for each country-sector } n, i$$

- Segmented labor markets:

$$w_{ni}^{\$} \geq \frac{\bar{w}_{ni}}{\varepsilon_n}, \quad \bar{L}_{ni} \geq L_{ni}, \quad (\bar{L}_{ni} - L_{ni}) \left(w_{ni}^{\$} - \frac{\bar{w}_{ni}}{\varepsilon_n} \right) = 0 \quad \text{for each country-sector } n, i$$

Market clearing

- Goods market clearing (as consumption or intermediate goods)

$$Y_{ni} = \sum_{m=1}^{\mathcal{N}} (X_{m,ni} + C_{m,ni}) \quad \text{for each country-sector } n, i$$

- Segmented labor markets:

$$W_{ni}^{\$} \geq \frac{\bar{W}_{ni}}{\mathcal{E}_n}, \quad \bar{L}_{ni} \geq L_{ni}, \quad (\bar{L}_{ni} - L_{ni}) \left(W_{ni}^{\$} - \frac{\bar{W}_{ni}}{\mathcal{E}_n} \right) = 0 \quad \text{for each country-sector } n, i$$

- Segmented capital markets: *no* price rigidities $\rightarrow K_{ni} = \bar{K}_{ni}$

Market clearing

- Goods market clearing (as consumption or intermediate goods)

$$Y_{ni} = \sum_{m=1}^{\mathcal{N}} (X_{m,ni} + C_{m,ni}) \quad \text{for each country-sector } n, i$$

- Segmented labor markets:

$$w_{ni}^{\$} \geq \frac{\bar{w}_{ni}}{\varepsilon_n}, \quad \bar{L}_{ni} \geq L_{ni}, \quad (\bar{L}_{ni} - L_{ni}) \left(w_{ni}^{\$} - \frac{\bar{w}_{ni}}{\varepsilon_n} \right) = 0 \quad \text{for each country-sector } n, i$$

- Segmented capital markets: *no* price rigidities $\rightarrow K_{ni} = \bar{K}_{ni}$
- Asset Markets clear: $\sum_n F_{n,t} = 0, B_{n,t} = 0$
 - * $F_{n,t}$, allows for endogenous current account/trade balance movements

Calibration

Parameters

- ▶ Calibrate the model with ICIO 2018 Table from OECD
 - * Final use shares
 - * Input shares
 - * Value added shares
 - * Expenditure shares
 - * Allow for initial trade imbalances

Parameters

- ▶ Calibrate the model with ICIO 2018 Table from OECD
 - * Final use shares
 - * Input shares
 - * Value added shares
 - * Expenditure shares
 - * Allow for initial trade imbalances
- ▶ Elasticities: p -complementarities
 - * Between value added and intermediate inputs: $\theta = 0.6$ (Atalay, 2017; Carvalho et. al, 2021)
 - * Between labor and capital: $\eta = 0.6$ (Raval, 2019; Oberfield and Raval, 2021)
 - * Among intermediates: $\epsilon = 0.2$ (Atalay, 2017; Boehm, Flaaen, and Pandalai-Nayar, 2019)
 - * Cross-country Armington: $\xi^S = \xi^C = 0.6$ (Boehm, Levchenko and Pandalai-Nayar (2023)
 - * more configurations in the paper

Shocks

- ▶ Time period: 2019Q1–2022Q2.
- ▶ Shocks: all in deviations from 2018Q4 value

Shocks

- ▶ Time period: 2019Q1–2022Q2.
- ▶ Shocks: all in deviations from 2018Q4 value

1. Sectoral demand shocks

+ Sectoral expenditure shares changes in country n $\sum_{j \in \mathcal{J}} d\Omega_{nj} = 0$

Shocks

- ▶ Time period: 2019Q1–2022Q2.
- ▶ Shocks: all in deviations from 2018Q4 value
 1. Sectoral demand shocks
 - + Sectoral expenditure shares changes in country n $\sum_{j \in \mathcal{J}} d\Omega_{nj} = 0$
 2. Country-level aggregate demand shocks, $\hat{\phi}_{n,0}$
 - + use nominal local currency expenditure changes and interest rates

Shocks

- ▶ Time period: 2019Q1–2022Q2.
- ▶ Shocks: all in deviations from 2018Q4 value
 1. Sectoral demand shocks
 - + Sectoral expenditure shares changes in country n $\sum_{j \in \mathcal{J}} d\Omega_{nj} = 0$
 2. Country-level aggregate demand shocks, $\hat{\phi}_{n,o}$
 - + use nominal local currency expenditure changes and interest rates
 3. Country-sector potential supply shocks, $\hat{L}_{ni,o}$
 - + Observed Δ in total hours worked in country n , sector i

Shocks

- ▶ Time period: 2019Q1–2022Q2.
- ▶ Shocks: all in deviations from 2018Q4 value
 1. Sectoral demand shocks
 - + Sectoral expenditure shares changes in country n $\sum_{j \in \mathcal{J}} d\Omega_{nj} = 0$
 2. Country-level aggregate demand shocks, $\hat{\phi}_{n,o}$
 - + use nominal local currency expenditure changes and interest rates
 3. Country-sector potential supply shocks, $\hat{L}_{ni,o}$
 - + Observed Δ in total hours worked in country n , sector i
 4. Energy shocks: IMF commodity price index
 - + maps to productivity shock in Russian energy sector in 2022 $\hat{A}_{(\text{Russia, Energy}),o}$ (lower bound)

Shocks

- ▶ Time period: 2019Q1–2022Q2.
- ▶ Shocks: all in deviations from 2018Q4 value
 1. Sectoral demand shocks
 - + Sectoral expenditure shares changes in country n $\sum_{j \in \mathcal{J}} d\Omega_{nj} = 0$
 2. Country-level aggregate demand shocks, $\hat{\phi}_{n,o}$
 - + use nominal local currency expenditure changes and interest rates
 3. Country-sector potential supply shocks, $\hat{L}_{ni,o}$
 - + Observed Δ in total hours worked in country n , sector i
 4. Energy shocks: IMF commodity price index
 - + maps to productivity shock in Russian energy sector in 2022 $\hat{A}_{(\text{Russia, Energy}),o}$ (lower bound)
 5. Set country-sector productivity changes to zero, $\hat{A}_{ni,o} = 1$

Conclusion

Conclusion

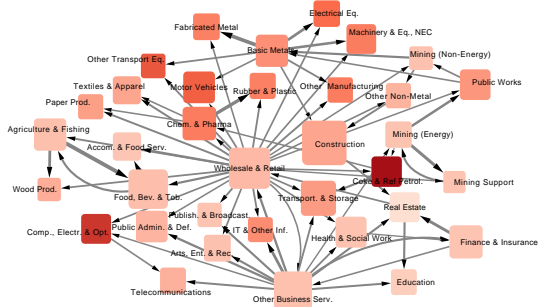

- ▶ We develop a model with IO linkages, nominal rigidities and trade across countries
- ▶ We use it to study the recent inflationary episode 2020–2022
- ▶ Model can match aggregate and sectoral outcomes
- ▶ Provided a set of shocks → useful for policy makers
- ▶ Takeaway: more about supply-demand imbalances than supply/demand alone.
- ▶ Much more work to do!

Thank you!

Calculating Inflation – Auxiliary Matrices

- ▶ Industry shares in consumption baskets:

$$\Omega^{CS} \equiv \Omega^C \Omega^{CB}.$$

- ▶ Industry to industry flows:

$$\Omega^{SS} \equiv \Omega^Y \Omega^Z \Omega^X.$$

- ▶ All direct and indirect flows from industry to industry (Leontief Inverse):

$$\Psi = [I - \Omega^{SS}]^{-1}$$

- ▶ Factor shares (for all factors, including labor and capital):

$$\Omega^F \equiv \Omega^Y \Omega^{VA}.$$

Domestic CPI inflation in a global economy

1. Prices in dollars ($d \log P^{\$}$):

$$d \log P^{\$} = -\Psi d \log A + \Psi \Omega^F d \log W^{\$}$$

2. Country's n CPI changes

$$d \log CPI_n = (\Omega_n^{CS})^T d \log P^{LC,n} = d \log \mathcal{E}_n + (\Omega_n^{CS})^T d \log P^{\$}$$

3. Relate factor price f to its factor share at the *world level* $\Lambda_f = W_f^{\$} L_f / E_W^{\$}$

$$d \log W_f^{\$} = d \log E_W^{\$} + d \log \Lambda_f - d \log L_f$$

Domestic CPI inflation in a global economy

- CPI changes (where $(\lambda^n)^T = (\Omega_n^{CS})^T \Psi$ and $(\Lambda^n)^T = (\lambda^n)^T \Omega^F$)

$$\begin{aligned} d \log \text{CPI}_n = & \underbrace{d \log E_W^{\$}}_{\text{World Expenditure}} + \underbrace{d \log \mathcal{E}_n}_{\text{Exchange Rate}} - \underbrace{(\lambda^n)^T d \log A}_{\text{Productivity Shocks}} \\ & - \underbrace{(\Lambda^n)^T d \log L}_{\text{Factor Changes}} + \underbrace{(\Lambda^n)^T d \log \Lambda}_{\text{Local-Global D-S Imbalance}} \end{aligned}$$

- *World expenditure*: US interest rate and countries intertemporal shifters.

Domestic CPI inflation in a global economy

- CPI changes (where $(\lambda^n)^T = (\Omega_n^{CS})^T \Psi$ and $(\Lambda^n)^T = (\lambda^n)^T \Omega^F$)

$$\begin{aligned} d \log \text{CPI}_n = & \underbrace{d \log E_W^{\$}}_{\text{World Expenditure}} + \underbrace{d \log \mathcal{E}_n}_{\text{Exchange Rate}} - \underbrace{(\lambda^n)^T d \log A}_{\text{Productivity Shocks}} \\ & - \underbrace{(\Lambda^n)^T d \log L}_{\text{Factor Changes}} + \underbrace{(\Lambda^n)^T d \log \Lambda}_{\text{Local-Global D-S Imbalance}} \end{aligned}$$

- *Exchange rate term*: country interest rate relative to the US.

Domestic CPI inflation in a global economy

- CPI changes (where $(\lambda^n)^T = (\Omega_n^{CS})^T \Psi$ and $(\Lambda^n)^T = (\lambda^n)^T \Omega^F$)

$$\begin{aligned} d \log \text{CPI}_n = & \underbrace{d \log E_W^{\$}}_{\text{World Expenditure}} + \underbrace{d \log \mathcal{E}_n}_{\text{Exchange Rate}} - \underbrace{(\lambda^n)^T d \log A}_{\text{Productivity Shocks}} \\ & - \underbrace{(\Lambda^n)^T d \log L}_{\text{Factor Changes}} + \underbrace{(\Lambda^n)^T d \log \Lambda}_{\text{Local-Global D-S Imbalance}} \end{aligned}$$

- *Productivity shocks*: Productivity changes weighted by the importance of sector in consumption basket of country n .

Domestic CPI inflation in a global economy

- ▶ CPI changes (where $(\lambda^n)^T = (\Omega_n^{CS})^T \Psi$ and $(\Lambda^n)^T = (\lambda^n)^T \Omega^F$)

$$\begin{aligned} d \log \text{CPI}_n = & \underbrace{d \log E_W^{\$}}_{\text{World Expenditure}} + \underbrace{d \log \mathcal{E}_n}_{\text{Exchange Rate}} - \underbrace{(\lambda^n)^T d \log A}_{\text{Productivity Shocks}} \\ & - \underbrace{(\Lambda^n)^T d \log L}_{\text{Factor Changes}} + \underbrace{(\Lambda^n)^T d \log \Lambda}_{\text{Local-Global D-S Imbalance}} \end{aligned}$$

- ▶ *Factor quantity changes*: Labor changes weighted by the importance of factor in providing for the consumption basket of country n .
 - * An endogenous object due to downward-wage rigidity.

Domestic CPI inflation in a global economy

- CPI changes (where $(\lambda^n)^T = (\Omega_n^{CS})^T \Psi$ and $(\Lambda^n)^T = (\lambda^n)^T \Omega^F$)

$$\begin{aligned} d \log \text{CPI}_n = & \underbrace{d \log E_W^{\$}}_{\text{World Expenditure}} + \underbrace{d \log \mathcal{E}_n}_{\text{Exchange Rate}} - \underbrace{(\lambda^n)^T d \log A}_{\text{Productivity Shocks}} \\ & - \underbrace{(\Lambda^n)^T d \log L}_{\text{Factor Changes}} + \underbrace{(\Lambda^n)^T d \log \Lambda}_{\text{Local-Global D-S Imbalance}} \end{aligned}$$

- Changes in global factor shares and local factor shares.
- * Endogenous object: integrates changes in demand and supply factors.
 - * Depends on global IO structure and substitution patterns.

Segmented factor markets during collapse and recovery

- \bar{L}_f : Potential level for factor f . Decrease due to sick workers, shutdowns, etc.

Segmented factor markets during collapse and recovery

- \bar{L}_f : Potential level for factor f . Decrease due to sick workers, shutdowns, etc.

Segmented factor markets during collapse and recovery

- ▶ \bar{L}_f : Potential level for factor f . Decrease due to sick workers, shutdowns, etc.
- ▶ L_f : Equilibrium employment level for factor f
 - * Demand effects+downward wage rigidity \Rightarrow workers employed might be lower than *potential*
- ▶ Difference between \bar{L}_f and L_f : Keynesian unemployment
